The present invention is a protective garment for individuals which includes a hoodie with a hood and a pair of sleeves, a head protective element and elbow, shoulder, wrist, back and torso protective pads. The head protective element is coupled to the hood of the hoodie by a fastening system. Each of the elbow protective pads is coupled to the hoodie by a fastening system. Protective elements are spacer fabrics filled with a shear thickening (also known as dilatant) gel having flexibility and drape-ability so as not to degrade the natural "cool" look of a standard garment.
